

Balance and Posture

Moderate evidence base · 12–15 minutes

Read slowly — about 30–45 seconds per paragraph. There is no hurry.

PART I · BREATH AND LIGHT

Settle into whatever is supporting you right now. Let the surface take your weight. There is nothing to hold up in this practice. Let it all down.

Take a slow breath in. Let it out slowly. On each out-breath, let a little more of the body's held tension release. The shoulders. The jaw. The hands.

Bring warmth to the top of your head. Let it descend with each breath. This time, let the warmth travel all the way down to the base of your spine — to the pelvis, the sitting bones, the very foundation of your body. The weight of you is here. The centre is here.

PART II · THE IDEAL BEING

In front of you there is a figure, standing. You may see them, or simply sense them there — either is right. They are simply standing: not performing, not bracing. Their weight is even. Their spine is easy and long. There is a soft, relaxed steadiness about them.

Notice what this is like when it is not effortful. The slight, continuous movement of the body — barely there — as it makes small adjustments to stay upright. The trusting of the ankles. The quiet hips. The calm in the shoulders. No gripping. No compensating. Just a body that knows where it is in space.

The figure steps into you. Now you are standing — or imagining standing. Either is fine. The ground under your feet. The weight distributing. The length in the spine. The head sitting easily at the top of it all. You are upright. Centred. The balance is happening. It doesn't need managing.

PART III · THE ANATOMICAL PATHWAY

Bring your awareness to the back of your skull — the base of your brain. Your cerebellum is here. It's always working, always receiving signals from your inner ear, your joints, your muscles. It's the coordinator of balance. Sense it there — not a sharp picture, just a sense of something quietly, steadily active.

Bring attention to your inner ear. The fluid inside it, reporting the position of your head. The parts that sense gravity. This information is flowing to your cerebellum right now. Let it flow. Don't interfere. Just notice it.

Now bring attention to your joints — wherever they are, whatever position they're in. Your ankles. Your knees. Your hips. Each one is sending signals upward, reporting its angle, its tension, its load.

Your cerebellum takes it all in. Puts it together. Sends correcting signals back out to the muscles that hold you upright — the deep muscles along your spine, the muscles around your hips, the small muscles in your ankles.

Now sense yourself upright. Standing. The whole system working the way it was built to. Signal in, signal out, balance kept — not because you're gripping or thinking hard, but because the system is running. Let it run.

PART IV · BREATH AND LIGHT

Return to the breath. Return to wherever you are — sitting, lying, resting. You are supported. The practice has been received. The imagery settles.

Carry a fragment of this today: the spine long, the weight dropping through the feet, the balance just happening. In any window of quiet — a slow breath, a pause — return to it. Three long breaths now. The room around you. Enough.

Pathway: Inner ear and joint/muscle signals → cerebellum → brain and spinal cord pathways → muscles that keep you upright (spine, hip, ankle).
